- The cosmos is many things: a blade of grass, a star, the moon, DNA, a cup of coffee, a living cell, gold, a galaxy, earth, an atom, time, a beetle, water, a book, a woman, language, an idea, C60, hate, DW40, a church, a shoe, a flower, fire, an icosahedron, a baseball, love, space, a hat, good, electromagnetism, bread, butterfly, evil, music, pizza, a computer, a quark, a nebula, everything else...
- These uncountable things in the cosmos are PARTICULARS.
- Like the pieces of the jigsaw puzzle are a SUBSET of the picture on the front of its box, particulars are a subset of the BIG-PICTURE the cosmos.
- The subset points to a LARGER REALITY.
- The particular points to the universal, giving the particular MEANING.
- Earth's sun is a star closer to the edge of the Milky Way galaxy than its nucleus, and is a subset of this galaxy.
- The Milky Way galaxy is a subset of the Local Group, the galaxy cluster of some three dozen galaxies.
- The Local Group is a subset of the galaxy supercluster known as the Virgo supercluster.
- Superclusters like tattered patterns of ribbon are the final largest structures in the cosmos.
- Beyond the supercluster and the boundary of cosmos is the God algorithm.
- The God algorithm began with "Let there be light!" giving final meaning to the cosmos.
- We call the pattern of subset pointing to the larger reality of meaning a SIGNPOST.
- Particulars are signposts that point to meaning, but particulars possess no AUTONOMOUS meaning in and of themselves.
- QUESTION: Why does any of this matter???
- ANSWER: We are programmed to resolve meaning!!!
- That is our purpose...
